Importing historical data for analytics - timr ===== tptacek The problem is you don't know

what is a "historical data", because any time a thing changes, it's a new fact; a historical data point is just the constant and value of that new fact. The traditional way to deal with this is to mark the passage of time with an "epoch". A typical epoch is "Date: June 10, 2013". The "epoch" approach is really a way to make sure that you don't

mistakenly treat a temporal value as a spatial value, which is a different thing. ~~~ timr _" The problem is you don't know what is a "historical data", because any time a thing changes, it's a new fact; a historical data point is just the constant and value of that new fact."_ That's true. And that makes _historical data points_ different

from spatial points in time.
Instead of a constant that is
constant, it is a constant variable
that is constant. It's no less
compelling, though: you're just
spreading the problem of
aggregation across time instead
of space. ~~~ sounds You are
spreading the problem of
aggregation across time instead of

space. ~~~ timr Obviously we're not talking about the same thing. And without any additional metadata, a historical value that has "epoch" marked is indistinguishable from one that doesn't: I could create a historical data point for a value for a day that never happened. There's no internal mechanism for

differentiating between these. ~~~
